

JMJ Intelligence — the whole picture

One scroll: the partnership, the structure, what we've already built, the Cisco seam, the risks, and the next move. Working brainstorm — not a finished pitch.

1 • THE FRAME

2 • STRUCTURE & LICENSING

3 • WHAT WE'VE BUILT

4 • MODULES & ENGINES

5 • THE CONVERGENCE

6 • CISCO & AI POD

7 • RISK & FIX

8 • OPEN QUESTIONS

9 • NEXT MOVE

01 The frame DECIDED

SodaLabs + JMJ in partnership. Two different animals, one shared spine.

SODALABS • THE ENTERPRISE

Must make money to prosper

A commercial enterprise — building, owning and driving the system. Profit isn't in tension with the mission; it's what sustains it.

JOZI MY JOZI • THE NON-PROFIT

The public-interest face

Mission-driven, civic credibility, the CoJ/CGIS relationship and the brand. Operating surplus ploughs back into the city.

THE SHARED SPINE

One central intelligence system — and we've already built it

Both run on a single intelligence system: "**the Mind**" — the engine, knowledge graph and corpus SodaLabs already operates. One system, two missions on top: JMJ uses it for public good, SodaLabs commercialises it.

02 Structure & licensing DECIDED

It starts as Soda IP. Soda sets up & drives it for a licence fee, keeps building it up, and the core always stays ours. Modules get tagged Soda vs JMJ as we go. Sold as one package.

1

The core / the engine — Soda IP

We built it, we drive it, we improve it. Never sold, never assigned. The core module always remains ours.

SODALABS • LICENCE FEE

2

The modules — tagged as we build

A growing library on top of the core. Each new module classified **SodaWorld module** or **JMJ module** as we go (some co-owned).

SODA / JMJ • PER MODULE

3

Every new city — a new licence

Each city = a new SodaLabs licence + a new co-owned city architecture. Recurring, not one-off. ("City My City.")

NEW LICENCE EACH CITY

Sold as a package. Core + modules wrapped as one offering to the city/market. JMJ is the public vehicle that *uses* the engine; SodaLabs owns and monetises the spine. The non-profit can't own the engine precisely because it can't be the thing that profits.

03 What we've already built

VERIFIED • ELIYAHU CENSUS

Pulled live from the Mind, not memory. This is the asset a frontier model can't have: proprietary, local, dated, ours.

17

custom AI agents (6 engines + 11 operators)

04 Modules & engines

One engine, many products. The core engines are the Soda IP; the civic products are what JMJ sees.

★ CORE ENGINES (8) — SODA IP

- › **Knowledge / RAG engine** — the Mind
- › **White-label engine**
- › **Auth seam · Payment seam**
- › **Agentic CMS · Review-gate**
- › **Image pipeline · Highlight/media**

MODULE CATALOG (85+)

Coach · Legal · Builder · Finance · Manager · Research · Organizer · Messenger · Vault ... each on the Universal Agent Interface. BASA is the first tenant licensing them.

• LIVE CIVIC PRODUCTS

- › **CoJ Property Atlas** — owners, CID, culture, provenance
- › **City Maps** — Koki Roads / Drive, Drivable Joburg
- › **3D City Twin** — Troyeville→Hillbrow
- › **ABSA suite** — acquisition intelligence
- › **Cisco suite** — Intelligence Center + 40 Communities

THE 6 ENGINE-AGENTS

- › **Andy** — knowledge/RAG (the Mind)
- › **Farcake** — civic/research (80+ APIs)
- › **Manfred** — media/archive (12,825 assets)
- › **Bird Fountain** — GPU image
- › **Leeyo** — property / 3D atlas
- › **Eliyahu** — synthesis / provenance

REAL-TIME + SPATIAL

- › Live-streaming virtual channel (PWA)
- › Chat + gamification + analytics
- › **SodaWorld Spatial** — Quest 3 app
- › VRChat / Unity venues · SodaStudio

THE MOAT

AI extraction from physical books & archives + 25 yrs JHB heritage + provenance stamps. A competitor would need the same corpus. Local 5090 inference ≈ R0.

05 The convergence ELIYAHU'S READ

Corrie's strawman (slides 8 + 11) describes, almost line-for-line, the machine the fleet already runs. The gap is packaging, not invention.

STRAWMAN ASKS FOR...	WE ALREADY RUN...
City Knowledge Graph (nodes + layers)	Andy's entity GraphRAG — 8,425 entities / 10,341 edges
AI document ingestion (books → entities/dates/places)	The Mind — 121,698 chunks, cited ask, nightly refresh
"5D: agents continuously compile/validate/update"	The fleet itself + provenance stamps + review-gates
RAG natural-language querying	Live — answers cited, or honestly "not documented"
Map interface	The Atlas — the cinematic node-graph
Cultural layer corpus	Joburg spine — buildings, history 1886–2019, 1,414 venues

The partnership in one line: JMJ supplies the mandate, the brand, and the CoJ/CGIS relationship; SodaLabs supplies the working engine, the corpus head-start, and the provenance doctrine that unlocks the city's data. *Cisco/Azure bring rails — we bring the thing that runs on the rails.*

06 Cisco seam & AI POD

Their infrastructure × our intelligence. Our stack is Docker-native and already does local-GPU inference — so running on a Cisco AI POD is a port, not a rebuild.

CISCO · INFRASTRUCTURE

The platform (AI POD)

- › GPU compute — H100/H200/RTX Pro 6000
- › OpenShift (Kubernetes)
- › VAST/Pure storage + VAST InsightEngine (RAG)
- › 40 Communities + global reach

SEAM

SODALABS · INTELLIGENCE

The living layer (the Mind)

- › Engine + knowledge graph + corpus
- › Atlas, twin, culture & CID layers
- › Provenance doctrine — the legal unlock
- › Measurable · targetable · replicable

WHAT WE NEED TO RUN ON CISCO

- › **Model serving:** open models via NVIDIA NIM on-POD (+ Claude API hybrid) — the only new piece
- › **Containerise for OpenShift** — minor, we're Docker-native
- › **Data tier on POD storage** — Postgres+pgvector, graph, archive
- › **GPU sizing** — one POD covers inference+embeddings+image+OCR

WHY IT'S THE MOVE

- › City data lives **on-prem in Joburg** = sovereign, not foreign cloud
- › We become Cisco's **flagship civic showcase**
- › The **POD is Cisco capex** (in-kind) — not ours
- › Turns "asking for charity" into "giving their product a marquee"

07 The risk & the fix WATCH

⚠ The trap

Corrie's strawman: slide 2 = non-profit, profits back to JMJ; slide 9 = SodaLabs as a vendor **cost-line** next to Azure/Cisco. The deck specs an engine we've already built. **"Greater-good wrappers become reasons to never pay."** Pour the engine into a non-profit with no structural return → we fund it all and earn nothing.

✓ The fix

Engine **licensed, never assigned**. SodaLabs = founding technology owner-partner with the licence fee + per-city model living **outside / above the non-profit**. Get it in writing while it's still a strawman — the cheapest moment to set terms. (Team slide already says "constituted as CV and MB" — if MB = Mic, we negotiate from inside-out.)

08 Open questions — decide these OPEN

? Who is the ONE named anchor buyer?

The strawman's 8 customer segments (heritage → gamers) = no buyer. Collapse to one nameable anchor: **CoJ** via **CGIS, AngloGold CSI**, or a **heritage / smart-city grant**.

? Governance — DAO-shaped or conventional custodial?

The "by the community, self-governing, tokenisation" language is DAO-shaped. Decide it, don't imply it. Purpose-locked governance lets NPO custodianship + commercial rails coexist.

? Which modules are Soda vs JMJ?

Core stays Soda. Tag each new module as we build. Agree the principle now, the line per-module later.

? Revenue split + per-city licence terms

Licence fee level, revenue share %, and what flips when CoJ pays. Modelled in the live cost tool.

09 The next move

Answer slide 17 with a demo, not a deck

A 2–3 week SodaLabs PoC: the Troyeville / inner-city block Atlas — GeoLIS public layers + our buildings/heritage/venues corpus + one copyright-cleared historical book → the City Atlas demo with cited ask + an auto-generated "Edition" (report + dashboard + API in one). Before/after case study built in. Anchored to ONE named funder conversation.

Demo beats deck

Weeks, not quarters

One named anchor

Licence terms in writing first
